

Phase 3 VALIDATION GRID — FULLSTACK JS Project			
Type	Criterion	Detailed Description	Pts
Individual	Back-end: implementation & web service exposure	REST/GraphQL API, business logic, data models, error handling and validation.	3
	Dynamic & ergonomic user interfaces	Reactivity, visual feedback, UX consistency, reusable components.	3
	Added Value & Declared use of AI coding tools	Student has added value and has put in considerable effort. Student documents every use of AI assistants (Copilot, Cursor, Claude, GPT...). Assessment focuses on ability to UNDERSTAND, ADAPT and JUSTIFY AI-generated code — not merely produce it.	4
	Individual contribution & technical expertise	Clear ownership of at least one feature; ability to explain technical choices; involvement measurable through Git history.	5

Total			15
Indiv Mark			20

Type	Criterion	Descriptors & Rubric	Pts
Team	Git usage & project management	Feature branches, pull requests, meaningful commit messages, tracked issues.	2
	Local integration — single-machine stack & Test Scenario	The complete fullstack application (front-end, back-end, database, AI module) runs correctly on a single development machine with a single command or clear setup guide. Environment variables documented. No broken dependencies.	2
	Embedded real AI feature	At least one feature powered by a real ML model (TensorFlow.js, ONNX, HuggingFace Inference, scikit-learn via API, fine-tuning, RAG pipeline...). Calling a third-party API (ChatGPT, Gemini) alone does NOT qualify — a model must be loaded, configured or trained within the project.	3

Team	Performance report	Written report (PDF or README section) documenting: API response time benchmarks, front-end load time (Lighthouse performance score), identified bottlenecks and optimisations applied or planned. At least 2 measured metrics with before/after or baseline comparison.	2
	Accessibility	Formal accessibility audit document: automated scan results (Lighthouse a11y score, axe-core output) + manual checklist (keyboard nav, screen-reader test on 2 key flows). All critical issues (level A/AA) fixed or explicitly tracked as issues.	2
	App deployment	Application is deployed and accessible via a public or shared URL.	2
